A probability of one represents certainty: if you flip a coin, the probability you'll get heads or tails is one (assuming it can't land on the rim, fall into a black hole, or some such). The probability of getting a given number of heads from four flips is, then, simply the number of ways that number of heads can occur, divided by the number of total results of four flips, 16.

A Modern Introduction to Probability and Statistics

Statistics is concerned with making inferences about the way the world is, based upon things we observe happening. Nature is complex, so the things we see hardly ever conform exactly to simple or elegant mathematical idealisations – the world is full of unpredictability, uncertainty, randomness. Probability is the language of uncertainty, and so to understand statistics, we must

Introduction - Statistics and Probability Tutorial ...

In probability theory and statistics, a probability distribution is the mathematical function that gives the probabilities of occurrence of different possible outcomes for an experiment. It is a mathematical description of a random phenomenon in terms of its sample space and the probabilities of events (subsets of the sample space).. For instance, if X is used to denote the outcome of a coin ...
